TITLE OF THE INVENTION

SPIRO-INDOLINES AS Y5 RECEPTOR ANTAGONISTS

SUMMARY OF THE INVENTION

5 This invention is concerned with compounds which are spiro-indolines
of general structure:

The invention is also concerned with the use of these novel compounds to selectively antagonize the Y5 receptors and thereby inhibit obsessive food intake and the resulting obesity and complications associated therewith.

The invention is also concerned with pharmaceutical formulations comprising one of the compounds as active ingredient.

The invention is further concerned with processes for preparing the compounds of this invention.

BACKGROUND OF THE INVENTION

Neuropeptide Y (NPY) is a member of the pancreatic polypeptide family with widespread distribution throughout the mammalian nervous system. NPY and its relatives elicit a broad range of physiological effects through activation of at least six G protein-coupled receptor subtypes known as Y1, Y2, Y3, Y4, Y5 and Y6. The Y5 subtype was isolated, characterized and reported recently in US Patent 5,602,024 (WO 96/16542).

The cited WO96/16542 also reports the discovery of chemical compounds which bind selectively to the Y5 receptor and which act as antagonists of the Y5 receptor, several of which were shown to inhibit food intake in rats.

Now with the present invention there is provided a class of compounds characterized as spiro-indolines, which are useful in the treatment, control or prevention of diseases, disorders or conditions mediated by activation of the Y5 receptor. These compounds are, thus, useful in the treatment of obesity in man or animals and in conditions caused by or exacerbated by obesity.

SCHEME I

The Cbz spiroindoline 3 is prepared according to the method described in *Tetrahedron* 53, 10983-10992 (1997).. In one procedure 3 is treated with a reagent R^2Cl , wherein R^2 is as defined above, in the presence of a base such as a tertiary amine, including triethylamine (Et_3N), diisopropylethylamine (DIEA), or pyridine, followed by removal of the carbobenzyloxy (Cbz) protecting group by hydrogenolysis with hydrogen over a noble metal catalyst at room temperature and pressure in a lower alcohol such as methanol or ethanol, or an etherial solvent such as diethyl ether or tetrahydrofuran (THF) or mixtures thereof to give 4 following the methods described in *Tetrahedron* 53, 10983-10992, (1997) wherein the preparation of 4 is described wherein R^2 is $-SO_2CH_3$.

Compound 4 (with R^2 protected if necessary) is then treated with a phenyl carbamate of structure $PHOCONH-Ar(R^4)(R^5)$ in the presence of a tertiary amine in an organic solvent such as a haloalkane such as chloroform, methylene chloride, ethylene dichloride or the like at reflux temperature or in the presence of NaOH in $H_2O/DMSO$, until the reaction is complete, usually in about 1/2 to about 3 hours followed by deprotection of the R^2 group if necessary, to provide the Compound I($R^3 = H$).

In the above procedures, the phenyl carbamates are prepared by reaction of the corresponding amines of structure $NH_2-Ar(R^4)(R^5)$ which are commercially available or readily synthesized, with phenyl chloroformate in pyridine at room temperature as described in Example I below.

Alternatively, Compound I is prepared by treatment of 4 with an isocyanate of structure $OCN-Ar(R^4)(R^5)$ in a chlorinated alkane at reflux temperature until the reaction is complete in about 4 to about 12 hours.

Compound I can also be prepared by conducting the above procedures in the reverse order. The indoline nitrogen of 3 is protected with Boc by treatment with di-*tert*-butyl dicarbonate in the presence of a base, such as, NaOH or triethyl amine, in an inert solvent such as aqueous dioxane or methanol and the Cbz group is hydrogenolyzed with hydrogen and a noble metal catalyst to give 5. Treatment of 5 with either the phenyl carbamate or isocyanate described earlier provides 6 which upon deprotecting with a strong acid such as hydrochloric or trifluoroacetic acid in an inert solvent such as ethyl acetate or methylene chloride and treatment with R^2Cl in the presence of a tertiary amine as described above provides Compound I($R^3 = H$).

35

Compounds of this invention are antagonists of the Y5 receptor and as such are useful for the prevention and treatment of disorders or diseases associated with the Y5 receptor sub-type, preferably for the treatment of feeding disorders such as obesity, anorexia nervosa and bulimia nervosa, and other abnormal conditions, such as diabetes, hypertension, hyperlipemia, hypercholesterolemia, congestive heart failure, renal dysfunction, sexual/reproductive disorders, depression, anxiety, shock, epileptic seizure, memory loss, sleep disturbance, pain, migraine, cerebral hemorrhage, nasal congestion, gastrointestinal disorders, arthritis and immunodeficiency syndrome.

The Y5 antagonists of this invention may also be used in combination with other anti-obesity agents for increased efficacy in the prevention and treatment of obesity. Such agents would include, but not be limited to: sibutramine; dextenfluramine; leptin; growth hormone secretagogues such as those disclosed and specifically described in US Patent 5,536,716; melanocortin agonists such as Melanotan II; Beta-3 agonists such as those disclosed and specifically described in patent publications WO94/18161, WO95/29159, WO97/46556, WO98/04526 and WO98/32753; 5HT-2 agonists; orexin antagonists; melanin concentrating hormone antagonists; galanin antagonists; CCK agonists; GLP-1 agonists; corticotropin-releasing hormone agonists; and Y1 antagonists.

The method of treatment of this invention comprises a method of antagonizing the Y5 receptor and treating Y5 receptor mediated diseases by administering to a patient in need of such treatment a non-toxic therapeutically effective amount of a compound of this invention that selectively antagonizes the Y5 receptor in preference to the other NPY receptors.

Dosage levels of the order of from about 0.01 mg to about 140 mg/kg of body weight per day are useful in the treatment of the above-indicated conditions, or alternatively about 0.5 mg to about 7 g per patient per day. For example, obesity may be effectively prevented or treated by the administration of from about 0.01 to 50 mg of the compound per kilogram of body weight per day, or alternatively about 0.5 mg to about 3.5 g per patient per day.

For the treatment of any of these Y5 receptor mediated diseases, compounds of the invention may be administered orally, topically, parenterally, by inhalation spray or rectally in dosage unit formulations containing conventional non-toxic pharmaceutically acceptable carriers, adjuvants and vehicles. The term

parenteral as used herein includes subcutaneous injections, intravenous, intramuscular, intrasternal injection or infusion techniques.

The novel pharmaceutical compositions of this invention containing the active ingredient may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example starch, gelatin or acacia, and lubricating agents, for example, magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. They may also be coated by the technique described in the U.S. Patent 4,256,108; 4,166,452; and 4,265,874 to form osmotic therapeutic tablets for controlled release.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredients is mixed with water or miscible solvents such as propylene glycol, PEGs and ethanol, or an oil medium, for example peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions contain the active material in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example sodium carboxymethylcellulose, methylcellulose, hydroxy-propylmethylcellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with

fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl, p-hydroxybenzoate, one or more colouring agents, one or more flavouring agents, and one or more sweetening agents, such as sucrose, saccharin or aspartame.

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil, for example arachis oil, olive oil, sesame oil or coconut oil, or in mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavouring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example sweetening, flavouring and colouring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the form of an oil-in-water emulsions. The oily phase may be a vegetable oil, for example olive oil or arachis oil, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavouring agents.

Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavouring and colouring agents. The

pharmaceutical compositions may be in the form of a sterile injectable aqueous or oleagenous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The sterile injectable preparation may also be a sterile
5 injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. Cosolvents such as ethanol, propylene glycol or polyethylene glycols may also be used. In addition, sterile, fixed oils are conventionally employed
10 as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

Compounds of the invention may also be administered in the form of a suppository for rectal administration of the drug. These compositions can be prepared
15 by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

For topical use, creams, ointments, gels, solutions or suspensions, etc., containing the compound of Formula I are employed. (For purposes of this
20 application, topical application shall include mouth washes and gargles.) Topical formulations may generally be comprised of a pharmaceutical carrier, cosolvent, emulsifier, penetration enhancer, preservative system, and emollient.

The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated
25 and the particular mode of administration. For example, a formulation intended for the oral administration of humans may contain from 0.5 mg to 5 g of active agent compounded with an appropriate and convenient amount of carrier material which may vary from about 5 to about 95 percent of the total composition. Dosage unit forms will generally contain between from about 1 mg to about 500 mg of an active
30 ingredient, typically 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg, 500 mg, 600 mg, 800 mg, or 1000 mg.

It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the age, body weight, general health, sex, diet, time of administration, route of administration, rate of

excretion, drug combination and the severity of the particular disease undergoing therapy.

The following Examples describe the laboratory synthesis of specific compounds of the invention and are not meant to limit the scope of the invention in any way with respect to compounds or processes. It is understood that, although
 5 specific reagents, solvents, temperatures and time periods are used, there are many possible equivalent alternatives that can be used to produce similar results. This invention is meant to include such equivalents.

EXAMPLE 1

1-Methanesulfonyl-N-(5-phenyl-2-pyrazinyl)spiro[indoline-3,4'-piperidine]-1'-carboxamide **100**

5

Step 1: Preparation of Compound 1-2

- Phenyl chloroformate (0.64 mL, 5.1 mmol) was added to a
- 10 vigorously stirred solution of 2-amino-5-phenylpyrazine **1-1** (794 mg, 4.64 mmol) in pyridine (10 mL) at room temperature. After being stirred at room temperature overnight, the mixture was diluted with EtOAc to give a suspension, in which the desired compound precipitated out. The suspension was successively washed with 1 N KHSO₄, brine and dist. water. The precipitate was collected by filtration and dried
- 15 to give phenyl N-(5-phenyl-2-pyrazinyl)carbamate **1-2** (847 mg, 63%). The filtrate was concentrated under reduced pressure to produce precipitate, which was collected and dried to give the second crop (340 mg, 25%).

Step 2: Preparation of Compound 100

- A mixture of phenyl N-(5-phenyl-2-pyrazinyl)carbamate **1-2** (7, 350 mg, 1.20 mmol), 1-methylsulfonylspiro[indoline-3,4'-piperidine] hydrochloride **1-3** (400 mg, 1.32 mmol) and Et₃N (0.5 mL, 3.6 mmol) in CHCl₃ (6 mL) was heated to reflux for 3 h.
- 5 After cooling, the mixture was diluted with EtOAc, washed with 10% citric acid, sat. NaHCO₃ and brine, dried over MgSO₄, and concentrated under reduced pressure to start precipitation. The precipitate was collected by filtration and dried *in vacuo* to give **100** (517 mg, 93%) as a white powder.
- m.p.: 201 - 203 °C.
- 10 ¹H-NMR (DMSO-d₆) was consistent with the proposed title structure.
- FABMS: 464 (M + H)

Determination of IC₅₀

LMtk- cells expressing human Y5 receptors were washed with 50 mM HEPES buffer (pH 7.4) containing 20% sucrose, homogenized and centrifuged at 1,000 x g for 15 min. The supernatant was centrifuged at 100,000 x g for 45 min. The pellets were resuspended in 5 mM HEPES buffer (pH 7.4) and centrifuged again. The membrane fraction was resuspended by a homogenizer in the same buffer and used for this study.

Binding of [¹²⁵I]PYY to the membrane was performed in 0.2 ml of 25 mM Tris buffer (pH 7.4) containing 10 mM MgCl₂, 1 mM PMSF, 0.1% bacitracin and 0.5% BSA. The membranes (100 - 300 µg/ml) were incubated at 25°C for 120 min with [¹²⁵I]PYY (25 pM). Bound and free peptides were separated by filtration using a GF/C glass filter (Whatman, England) presoaked with 0.3% polyethylenimine. The remaining radioactivity on the filter was quantitated using a Cobra™ (Packard, Japan). Specific binding of [¹²⁵I]PYY was defined as the difference between total binding and nonspecific binding in the presence of 1 µM PYY.

Employing the procedure described in Example 18, a representative number of the compounds of this invention were found to have IC₅₀ values less than 1 mM.

Using procedures similar to those described in Example 18, in which membranes expressing other NPY subtypes are used in place of the Y5 membranes, many of the compounds of this invention have great selectivity for the Y5 receptor over the NPY Y1, Y2 and Y4 receptors. For example, many of the compounds of this invention have

IC50 >1000 nM on Y1, Y2 and Y4 receptors.

EXAMPLE 20

5 Effect of Compound 100 on bovine pancreatic polypeptide (bPP)-induced food intake in Sprague-Dawley rats.

Materials and Methods

Male Sprague-Dawley rats aged 7 weeks (Charles River, Japan) were
10 maintained under the controlled temperature (23 ± 3 °C), humidity ($55 \pm 15\%$) and
light-dark cycle (7:00-19:00 light on). Rats were housed individually with *ad libitum*
access food (CE-2, Clea Japan) and tap water.

Rats were anesthetized with sodium pentobarbital (50 mg/kg, i.p., Dainabot,
Japan). A permanent stainless steel guide cannula for intracerebroventricular (ICV)
15 injection (21 gauge, 10 mm long) was stereotaxically implanted into the right lateral
ventricle. The stereotaxic coordinates used were as follows : 0.9 mm posterior and
1.2 mm lateral to the bregma and 1.5 mm ventral to the brain surface.

Animals were allowed at least 6-day recovery postoperatively before the start of
feeding experiment. The day before the experiment, they were handled and
20 underwent mock injection, and nocturnal food intake was measured. Rats which ate
more than 15 g during the night before the experiment were used for the following
experiment.

Test compounds were suspended in 0.5 % methylcellulose and orally
administered by gavage. Administration of test compounds usually began at 10:00.
25 Dosing volume was 5 ml/kg. One hour after the drug administration, bovine
pancreatic polypeptide (PP, 5 g/10 l/1 min) was ICV injected through a stainless
steel injector (26 gauge) attached to a 50 l Hamilton microsyringe by polyethylene
tubing. The injector extended 2 mm beyond the end of the guide cannula. Bovine PP
was dissolved in 10 mM PBS containing 0.05 % BSA. Two hour post-injection food
30 intake was measured for each rat.

Results

Compound 100 was orally administered 1 hour prior to the ICV-
injection of bPP in satiated male Sprague-Dawley rats. Compound 100 (1, 3, 10 and
35 30 mg/kg) suppressed bPP-induced food intake in a dose-dependent manner, and the

minimum effective dose is estimated to be 3 mg/kg. Furthermore, this compound at 100 mg/kg, p.o. did not cause any abnormal behavior in rats and mice during 24 hour after dosing. Thus, Compound 100 has a potent in vivo Y5 antagonistic activity without causing any abnormal behavior.

BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING

This ISA found multiple inventions as follows:

This application contains the following inventions or groups of inventions which are not so linked as to form a single inventive concept under PCT Rule 13.1. In order for all inventions to be searched, the appropriate additional search fees must be paid.

Group I, the invention according to claim 1, formula I, which contains pyrazine or pyridizine.

Group II, the invention according to claim 1, formula I, which contains piperidine, but not pyrazine or pyridizine.

Group III, the invention according to claim 1, formula I, which contains pyridine, but not piperidine, pyrazine or pyridizine.

Group IV, the invention according to claim 1, formula I, which contains thiadiazole, but not pyridine, piperidine, pyrazine or pyridizine.

Group V, the invention according to claim 1, formula I, which contains oxazole, but not thiadiazole, pyridine, piperidine, pyrazine or pyridizine.

Group VI, the invention according to claim 1, formula I, which contains imidazole, but not oxazole, thiadiazole, pyridine, piperidine, pyrazine or pyridizine.

Group VII, the invention according to claim 1, formula I, which contains indole, but not imidazole, oxazole, thiadiazole, pyridine, piperidine, pyrazine or pyridizine.

Group VIII, the invention according to claim 1, formula I, which contains thiazole, but not indole, imidazole, oxazole, thiadiazole, pyridine, piperidine, pyrazine or pyridizine.

Group IX, the invention according to claim 1, formula I, which contains thiophene, but not thiazole, indole, imidazole, oxazole, thiadiazole, pyridine, piperidine, pyrazine or pyridizine.

Group X, the invention according to claim 1, formula I, which does not contain thiophene, thiazole, indole, imidazole, oxazole, thiadiazole, pyridine, piperidine, pyrazine or pyridizine.

Claims 2-25 will be searched, commensurate in scope with the elected groups.

The inventions listed as Groups I-X do not relate to a single inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons: the common core is an amide, which is known in the art and therefore cannot be the special technical feature. The substituents, such as indole and oxazole, are structurally distinct.
